Android Security Project Walk-Through To-do-list Vulnerable Application

21pc07 - A Bhadri Narayanan

21pc08 - A Dharsann

21pc33 - A Shanju Shree

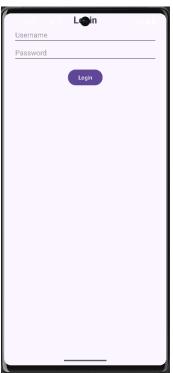

Task:

This APK file consists of several flags and vulnerabilities embedded inside the To-Do list application. The task is to exploit these vulnerabilities.

APK - https://drive.google.com/file/d/1p_iF1bjAWFnQVDu3wBjhij-OF3vRlv_s

Walk-through:

This is the login page of the application , where the username and the password is hardcoded inside the MainActivity.kt.

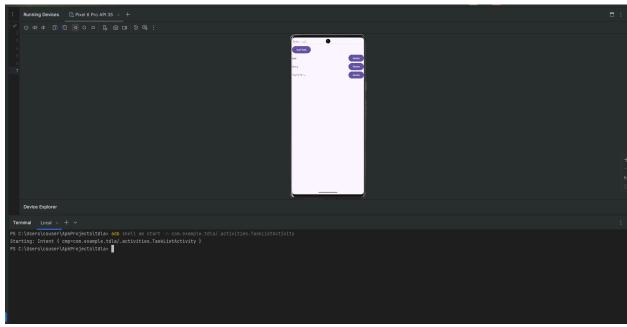

```
private final boolean validateLogin(String username, String password) {
    return Intrinsics.areEqual(username, "admin") && Intrinsics.areEqual(password, "12345");
}
```

After entering the credentials we get a flag - FLAG{HARDCODED CREDS}

There is a hidden vulnerability using which we can login without username and password. This is through giving the "am"(Activity Manager) command in the shell. The command is as follows:

adb shell am start -n com.example.tdla/.activities.TaskListActivity

Next is the SQL-injection vulnerability, where the payload to be given is 'OR '1'='1';

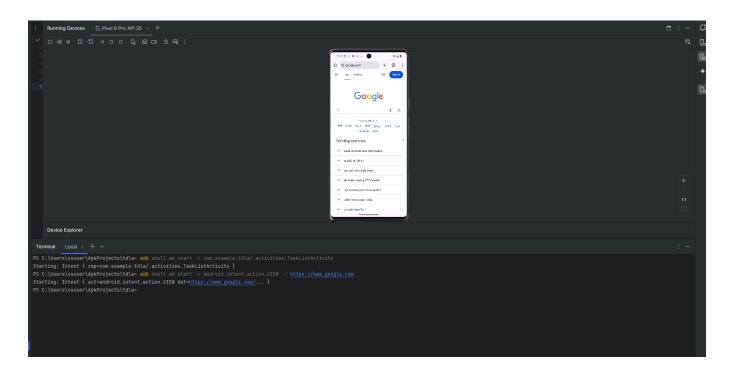

— We exploit this vulnerability to get the flag. The flag is FLAG{SQL INJECTION SUCCESS}

Next we explore the strings.xml file in the res/values directory to obtain the next flag - FLAG{HIDDEN IN STRINGS XML}

```
🖁 res/values/strings.xml 🗴 🍖 MainActivity 🗴 🝖 TasklistActivity 🗴 🍖 WebViewActivity 🗴 🝖 CryptoUtils 🗴

71
          <string name="m3_sys_motion_easing_standard">cubic-bezier(0.2, 0, 0, 1)</string>
          <string name="m3 sys motion easing standard accelerate">cubic-bezier(0.3, 0, 1, 1)</string>
```

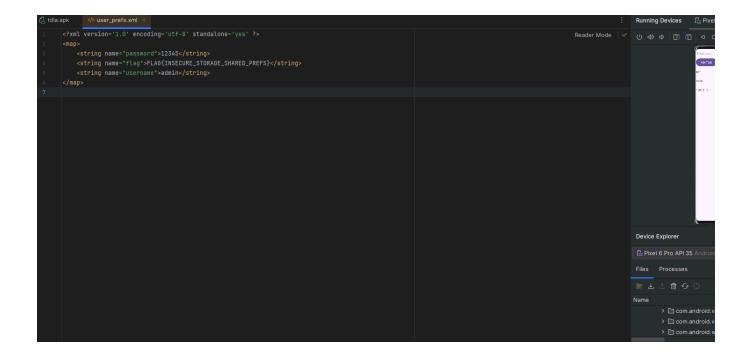

There is another vulnerability which can be prompted in the shell which allows us to open any URL such as a phishing link from a remote attacker directly.

6) Go to View -> Device Explorer and go to this directory /data/data/com.example.tdla/shared prefs/user prefs.xml.

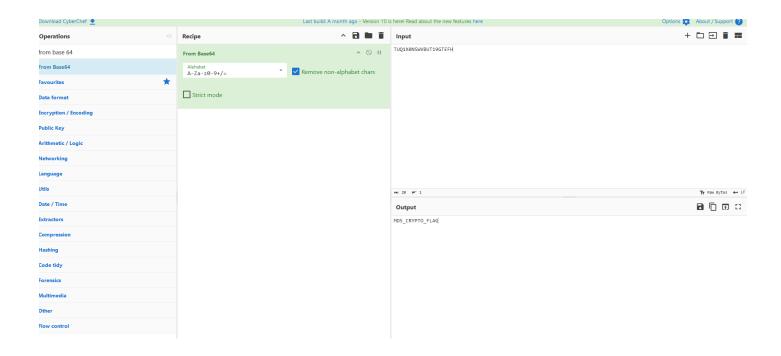

We can find the flag - FLAG{INSECURE_STORAGE_SHARED_PREFS}

```
private final void saveToSharedPrefs(String username, String password) {
    SharedPreferences sharedPreferences = this.sharedPreferences;
    if (sharedPreferences == null) {
        Intrinsics.throwUninitializedPropertyAccessException("sharedPreferences");
        sharedPreferences = null;
    }
    SharedPreferences.Editor editor = sharedPreferences.edit();
    editor.putString("username", username);
    editor.putString("password", password);
    editor.putString("flag", "FLAG{INSECURE_STORAGE_SHARED_PREFS}");
    editor.apply();
}
```

7) Next we have a cryptographic vulnerability inside the **CryptoUtils.kt** under utils directory in which we can discover our next flag. This will be in the encoded format which can be obtained through CyberChef (Recipe - to base64).

```
🚜 res/values/strings.xml 🗴 🍖 MainActivity 🗴 👵 TaskListActivity 🗴 👵 WebViewActivity 🗴 🥫 CryptoUtils
               package com.example.tdla.utils;
                import android.util.Base64;
               import androidx.constraintlayout.widget.ConstraintLayout;
import java.security.MessageDigest;
              import kotlin.Metadata;
import kotlin.jvm.internal.Intrinsics;
               import kotlin.text.Charsets;

String encodedFlag = Base64.encodeToString(rawHash, 2);
                                        return "FLAG{" + encodedFlag + "}";
```

The flag is: MD5_CRYPTO_FLAG

The List of Flags and Vulnerabilities in TDLA:

- 1. FLAG{HARDCODED_CREDS}
- 2. FLAG{SQL_INJECTION_SUCCESS}
- 3. FLAG{HIDDEN_IN_STRINGS_XML}
- 4. FLAG{INSECURE_STORAGE_SHARED_PREFS}
- 5. MD5_CRYPTO_FLAG
- 6. Hardcoded Credentials
- 7. Open an Activity without Login using adb
- 8. Open any Url using adb
